

# GOES Active Fire Detections - July 11, 2015

Great Basin East Geographic Area

This map, compiled by the USDA Forest Service Active Fire Mapping Program in cooperation with interagency and national partners, displays the location and relative detection time of all observed fires and other thermal activity through the specified database. Fire activity is identified from high temporal, synoptic view, multipass observations collected by the GOES Imager instrument aboard geostationary NOAA GOES satellite platforms. GOES satellites, located on eastern and western North America provide continual thermal observations of the continent at a rate of multiple times per hourly time period.

The Active Fire Mapping Program utilizes near real-time GOES imagery and derived data products provided by NOAA/ESDIS to construct this product. Fire activity visible at the time of satellite observation are identified and characterized at 4km spatial resolution using the latest version of the Wildfire Automated Biomass Burning Algorithm (WfABBA). A detected fire does not necessarily mean that the entire area represented by the 4km pixel is on fire. A detection may be the result of thermal activity covering a small fraction of the pixel area or fire activity occurring over a broader area. Fire detection commission/commission errors may occur due to input data anomalies, limited satellite observation conditions, and/or potential algorithm limitations.

Use of this map for other than its intended purpose may yield inaccurate or misleading results. The Forest Service attempts to use the most current and complete geospatial data available, and reserves the right to correct, update or modify geospatial inputs to this map without notification.
